# Final Project

**Davide Falessi**

**2026**

# The full story

1. A project was developed with bugs and smells
2. Milestone 1: we construct the dataset
3. Milestone 2: we identify accurate models
4. Milestone 3: we investigate how many of these bugs could have been prevented if we had zero smells.
5. Milestone 4: we investigate whether we could have zero smells by automated refactoring under different inputs (i.e., availability of specific tests).

# Report

1. Introduction
2. Methodology
    1. Milestone 1 (e.g., releases, proportion etc)
    2. Milestone 2 (e.g., classifiers, validation, filters)
    3. Milestone 3* (e.g., datasets)
    4. Milestone 4* (prompt, classes as input etc)
3. Results
    1. Milestone 1 (e.g., how many classes per release, are they stable, are they buggy?)
    2. Milestone 2 (e.g., how accurate is the most accurate, any surprise?)
    3. Milestone 3 (e.g., how many buggy classes could have been prevented?)
    4. Milestone 4 (e.g., does it compile, has it removed all smells?)
4. Threats to validity (limits: possible consequences and mitigation strategies
    1. assumptions, trade-offs, subjective decisions and rationale
5. Conclusions
6. Takeaway messages

**As provided in class.*
